

Technical Service Bulletin

Question: Why do my Jeep Sound bar (JC1-169SB) speakers only play bass?

Answer: The OEM jeep audio system sends low-pass signal to the JC1-169SB speakers, only allowing them to play low frequencies via the originally provided speaker connector.

Solution: By connecting the JC1-169SB to the OEM 3.5in speaker, the JC1-169SB speaker will be allowed to play a fuller range signal. The adapter harnesses (pictured below) for this conversion is available, please contact support@maxxsonics.com or call us directly at 847-540-7700 EXT 161 to have these adapters sent to you.

The Best Solution: For the best sound quality possible it is recommended to use a summing module and an amplifier to provide the JC1-169SB speakers with pure full range signal. Such as in the MBQJ-STG6A-1 complete audio kit for OEM radio.

Effected product: JC1-169SB, JE1-169SB, MBQJ-STG6-1
